MAIL DATE

DELIVERY MODE

03/31/2010

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/597,987	Applicant(s) SCHWIRTLICH ET AL.	
	Examiner MATTHEW J. SONG	Art Unit 1792	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on ____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. ____.
 3. ☒ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claim 23 rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 23 recites, "a range between 300°C and 1200°C, preferably between 1000°C and 1120°C" which a range with a range; therefore indefinite because it is unclear what range is being claimed.

3. Claim 24 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 2 recites, "an opening angle of preferable $30 < \alpha < 60$, in particular around 45°" which a range with a range; therefore indefinite because it is unclear if "particular α around 45°" is intended to limit the claim.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person

Art Unit: 1792

having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 1-5, 8-13, 17-18 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freedman et al (US 4,968,380) in view of Arvidson (US 2003/0131783).

Freedman et al teaches a process for conveying solid particles through at least one pipe or pipe system **60, 90** having a curve (**82** is a chamber which connects pipe **60** and **90** and the chamber is curved) where in fluid (Ar gas) is used for conveying the solid particles (Fig 2, col 3, ln 35-60; col 4, ln 35-65; col 5, ln 1-40). Freedman et al also teaches that the melt replenishment system is intended to operate with spherical silicon beads but the system can also be operated using irregularly shaped silicon particles having a specific dimensional characteristic (col 5, ln 60-68).

Freedman et al does not explicitly teach conveying irregular geometry particles as first solid particles and admixing them second solid particles of regular geometry. Freedman et al does teach the system can operate with spherical, regularly shaped silicon particles and irregularly shaped particles (col 5, ln 60-68). Therefore, It would have been obvious to a person

Art Unit: 1792

of ordinary skill in the art at the time of the invention to modify Freedman et al by combination regular and irregularly shaped particles because combination of known equivalents for the same purpose is prima facie obvious (MPEP 2144.06) and combinations of spherical beads and irregular silicon chunks is conventionally known in the art to be used to form silicon melts, as evidenced by Arvidson (US 2003/0131783) in paragraph [0019].

Referring to claim 2, the combination of Freedman et al and Arvidson et al teaches irregularly shaped particles ('380 col 5, ln 60-68). The combination of Freedman et al and Arvidson et al does not teach polygonal geometry. Changes in shape are prima facie obvious (MPEP 2144.04); therefore the use of polygonal geometry would have been obvious to one of ordinary skill in the art.

Referring to claim 3, the combination of Freedman et al and Arvidson et al teaches spherical particles ('380 col 5, ln 60-68).

Referring to claim 4, the combination of Freedman et al and Arvidson et al teaches the apparatus is intended to be used with spherical beads, however can be used with silicon particles of irregular geometry ('380 col 5, ln 60-68). Therefore, It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al by using a high percentage (50-99%) of spherical beads because the invention is intended be used with spherical beads.

Referring to claim 5, the combination of Freedman et al and Arvidson et al teaches Ar gas fluid ('380 col 5, ln 20-40).

Referring to claim 8, the combination of Freedman et al and Arvidson et al teaches a L/D ranges from about 1 to 1.2 ('380 col 5, ln 60-68), which is within the claimed range.

Art Unit: 1792

Referring to claim 9, the combination of Freedman et al and Arvidson et al is silent to the maximum length of the solid particle is the radius of the pipe. It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al by using particles with a maximum length equal to the radius of the pipe such that particles can flow through the pipe without clogging the pipe. Also, changes in size are prima facie obvious (MPEP 2144.04).

Referring to claim 10, the combination of Freedman et al and Arvidson et al teaches silicon particles ('380 col 5, ln 15-25).

Referring to claim 11-12, the combination of Freedman et al and Arvidson et al teaches irregularly shaped pieces obtained by breaking CVD polysilicon logs ('783 [0020]).

Referring to claim 13, the combination of Freedman et al and Arvidson et al teaches replenishing a silicon melt ('380 col 2, ln 5-35 and col 4, ln 55-6844

Referring to claim 17, the combination of Freedman et al and Arvidson et al teaches the particles are accelerated by the Ar gas ('380 col 5, ln 1-60).

Referring to claim 18, see the remarks above regarding claim 1. Also, the combination of Freedman et al and Arvidson et al teaches manufacturing silicon by crystallization of silicon from a melt ('380 col 2, ln 55-67).

Referring to claim 20, the combination of Freedman et al and Arvidson et al teaches Argon gas ('380 col 5, ln 1-60).

Art Unit: 1792

6. Claims 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freedman et al (US 4,968,380) in view of Arvidson (US 2003/0131783) as applied to claims 1-5, 8-13, 17-18 and 20 above, and further in view of Nagai et al (US 5,900,055).

The combination of Freedman et al and Arvidson et al teaches all of the limitations of claim 14, as discussed above, except the silicon melt is doped using doping elements present in the first solid particles.

In a method of growing crystals from a silicon melt, Nagai et al teaches a dopant feeding apparatus for charging a predetermined amount of dopant and dopant containing granular silicon (col 2, ln 1-10 and col 7, ln 1-67).

It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al by supplying a particles containing a dopant, as taught by Nagai et al, to produce a crystal having a desired dopant concentration and resistivity ('055 col 1, ln 5-67).

Referring to claim 15, the combination of Freedman et al and Arvidson et al and Nagai et al teaches born and phosphorous ('055 col 1, ln 20-40).

Referring to claim 16, the combination of Freedman et al and Arvidson et al and Nagai et al does not teach the claimed concentration. However, concentration is well known in the art to be a result effective variable; therefore It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al and Nagai et al by optimizing the concentration by conducting routine experimentation of a result effective variable (MPEP 2144.05).

Art Unit: 1792

7. Claims 6-7, 19, 21-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freedman et al (US 4,968,380) in view of Arvidson (US 2003/0131783) as applied to claims 1-5, 8-13, 17-18 and 20 above, and further in view of Mackintosh et al (US 6,562,132).

The combination of Freedman et al and Arvidson et al teaches all of the limitations of claim 6, as discussed above, except the fluid is supplied in pulses.

In a method of crystal growth, Mackintosh et al teaches silicon particles are introduced to a crucible to replenish a melt in the crucible during a growth process, and it is common practice to deliver the particles in predetermined intermittent basis according to the rate of consumption of the melt so as to maintain the level of the melt within predetermined limits (col 1, ln 10-65).

It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al by supplying the fluid intermittently (pulses) to supply the particles in a predetermined intermittent basis according to the rate of consumption of the melt so as to maintain the level of the melt within predetermined limits, as taught by Mackintosh et al.

Referring to claim 7, the pulses are either regular or irregular.

Referring to claim 19, the combination of Freedman et al and Arvidson et al teaches a conical deflecting element **66** ('380 col 3, ln 35-65). The combination of Freedman et al and Arvidson et al does not teach a baffle element surrounding the pipe, passing around the outer edge in the area of the melt and having a spherical surface section geometry. Mackintosh et al teaches particles impinge upon a deflect which deflects them back down toward a conical upper surface of an umbrella shaped feed director, which clearly suggests a baffle surrounding a feed tube and passing particles around the outer edge in the area of the melt, and the particles slide

Art Unit: 1792

down the director surface and fall into the melt along the outer edge (Fig 1-2 and col 5, ln 35-67 and col 8, ln 1-67). Mackintosh et al also teaches the inclined surface reduces the velocity of the particles so the particles will cause little or no splashing, thus eliminating the mushroom problem (col 8, ln 1-40). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al and Arvidson et al by using the director (baffle) taught by Mackintosh et al to reduce splashing of particles, thereby avoiding the mushroom problem. As to the spherical surface section geometry, it would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al, Arvidson et al and Mackintosh et al by using a spherical surface section geometry because changes in shape are prima facie obvious (MPEP 2144.04) and the combination of Freedman et al, Arvidson et al and Mackintosh et al teaches an umbrella shape which suggests a spherical surface geometry.

Referring to claim 21, the combination of Freedman et al, Arvidson et al and Mackintosh et al teaches an EFG process where the process may be used to grow shaped bodies with rectangular or circular configurations ('132 col 10, ln 55-67 and col 11, ln 1-40), thus one of ordinary skill the art would have found obvious to produce wafers as the shaped body because changes in shape are prima facie obvious (MPEP 2144.04) and a wafer shape is conventionally known in the art.

Referring to claim 23, the combination of Freedman et al, Arvidson et al and Mackintosh et al teaches an after heater **190** surrounding the direction and deflector, thus the deflector and director are expected to be heated. The combination of Freedman et al, Arvidson et al and Mackintosh et al is silent to the temperature, however temperature is well known in the art to be

Art Unit: 1792

result effective variable; therefore It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Freedman et al, Arvidson et al and Mackintosh et al by optimizing the temperature by conducting routine experimentation of a result effective variable. (MPEP 2144.05).

Referring to claim 22 and 24, the combination of Freedman et al, Arvidson et al and Mackintosh et al teaches the dimensions of the deflector and direction and angles may be may be to adjust the velocity of particles (‘132 col 10, ln 55 to col 11, ln 10), which clearly suggests the adapting the geometry. As to claim 24, changes in the shape of the deflector and director would have been obvious to one of ordinary skill in the art to control the distribution and velocity of particles.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to MATTHEW J. SONG whose telephone number is (571)272-1468. The examiner can normally be reached on M-F 9:00-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, Michael Kornakov can be reached on 571-272-1303. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
